CITELINE

Enable Precision Patient Recruitment with Lab Alerts

Empower investigators to consider every potential participant for your trial by alerting your site staff or CRO that a potential clinical trial participant presented at their site.

Lab Alerts provides near real-time notifications on study-specific positive lab results so study teams can focus their efforts on potentially eligible patients for your trial.

Focus on the patients relevant to your trial

Launch a patient recruitment campaign, prescreen, and direct participants to help study coordinators cut through the noise. Establish protocol-specific alerts to quickly identify potentially eligible patients using positive outcome data, streamlining their recruitment before the opportunity closes or they are recruited elsewhere.
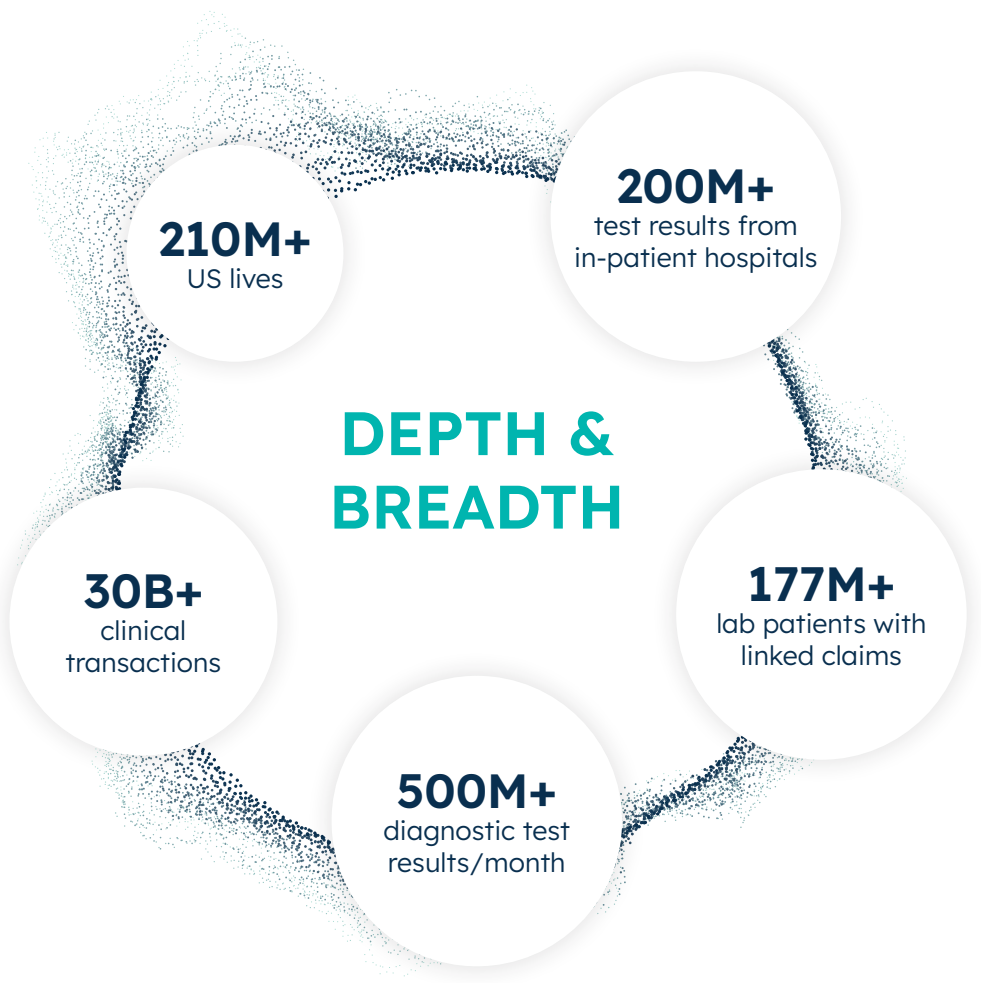

Never miss a relevant patient

Identify and alert your sites or CRO of potentially eligible patients within 24–48 hours of the lab result being posted.
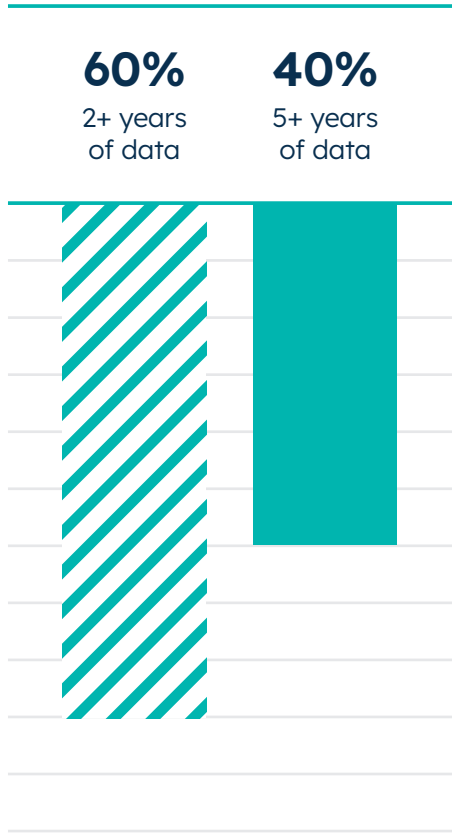

Get the full picture of the patient population

Our lab data is connected to the rest of our industry-leading datasets, giving you a full view of a patient's journey. Look across medical claims, Rx claims, diversity data, and EHR to tap into valuable patient journey insights.
